Differential Diagnosis
of the Pulmonary-Renal Syndrome

Martin Kimmel, Niko Braun and Mark Dominik Alscher

Department of Internal Medicine, Division of Nephrology,
Robert-Bosch-Hospital, Stuttgart
Germany

1. Introduction

The pulmonary-renal syndrome involves the combination of diffuse alveolar hemorrhage and a rapid progressive glomerulonephritis (RPGN). It is usually a systemic vasculitis that can lead through a vast vasculitic process to life-threatening injury to the involved organs lung and kidney [Niles 1996, Salant 1987, Boyce 1986, Gallagher 2002 & De Groot 2005]. In the differential diagnosis other diseases of acute renal and lung injury with alveolar hemorrhage without RPGN have to be discussed.

2. Pulmonary-renal syndrome

The diffuse alveolar hemorrhage is defined by the triad of hemoptysis, diffuse alveolar infiltrates and low hematocrit. However, the clinical presentation is variable (slight cough, progressive dyspnea, manifest hemoptysis) and these symptoms don’t have to occur simultaneously [Hauber 2007]. Slowly protracted courses through to fulminant organ failure are described. A rapid-progressive glomerulonephritis (RPGN) is manifested by a rapidly progressive renal function loss (a few days to few weeks) and the presence of a nephritic sediment with deformed erythrocytes of a glomerular origin and possibly red cell casts.

2.1 Pathophysiology

The underlying cause of a pulmonary-renal syndrome is usually a systemic vasculitis of the small pulmonary and renal vessels. These vasculitides have a heterogeneous pathogenesis - there are three different pathophysiological mechanisms of injury [Niles 1996, Salant 1987 & De Groot 2005]:

1. mediated by anti-neutrophil-cytoplasmic antibodies (ANCA),
2. immune-complex mediated vasculitis of small vessels or
3. by antibodies against the glomerular basement membrane (Goodpasture Syndrome).

In the kidney a RPGN is caused by damage of the capillaries and basal membranes with leakage of erythrocytes, followed by an influx of macrophages, fibrinogen and the formation of extracapillary cell proliferation (so called crescents) [Salant 1987]. In the lungs, a diffuse alveolar hemorrhage is caused by a pulmonary capillaritis [Hauber 2007]. In the case of ANCA-associated systemic vasculitis the detection of ANCA is possible in ~80% of patients. Besides the correlation of ANCA titers with disease activity, there is
evidence of a pathogenetic role of ANCA. Myeloperoxidase (MPO) and proteinase 3 (Pr3) are detected in the cytoplasm of non-stimulated neutrophils. It is assumed that cytokines (e.g. TNF, interleukins) raise the expression of Pr3 and MPO on the cell surface of granulocytes and thus a reaction of these antigens with ANCA is possible. This process leads to activation of granulocytes and release of adhesion molecules to the interaction of leukocytes with vascular endothelial cells. Finally cell necrosis and apoptosis contribute to vascular inflammation process [Bosch 2006].

2.2 Diagnosis
2.2.1 Basic steps
As with any systemic vasculitis the diagnosis of pulmonary-renal syndrome is made in three steps:
1. Adequate evaluation and networking of existing and past patient's symptoms.
2. Establishing the diagnosis by laboratory, technical and biopsy examinations.

2.2.2 Imaging
The value of imaging refers to the extent of pulmonary capillaritis resulting in diffuse alveolar hemorrhage: in a conventional X-ray or in a computer tomography of the chest confluent or mixed interstitial-alveolar infiltrates are found (Fig. 1).

![Diffuse alveolar hemorrhage in chest x-ray in Wegener's granulomatosis.](image_url)

In a RPGN sonographically enlarged kidneys presents with a wide parenchyma area.
2.2.3 Serology
Antibodies against the glomerular basement membrane (GBM) can be found typically in the rare Goodpasture's syndrome (Tab. 1). The above briefly described heterogeneous pathogenesis of small vessels vasculitis results in the immunological classification considering serological / immunological parameters such as anti-neutrophil-cytoplasmic antibodies (ANCA) by immunofluorescence-optical findings (perinuclear or cytoplasmatic fluorescence) or ELISA against the target antigen proteinase 3 or myeloperoxidase (Tab. 1) [Bosch 2006]. In addition, the eosinophils, IgE and the extended autoimmunserology: anti-nuclear factor (ANA), anti-ds-DNA, C3, C4 and cryoglobulins can be determined.

Table 1. ANCA-Sensitivity.

The rapid availability of these antibodies has improved the time to establish an early diagnosis, which is prognostically relevant [Saxena 1995].

2.2.4 Renal biopsy
The diagnosis of RPGN is done by renal biopsy: in light microscopy there is a glomerulonephritis with crescent formation in the Bowman's capsule compartment (extracapillary proliferation) in more than 50% of the glomeruli. The further work is carried out by immunohistochemistry and electron microscopy.

In immunohistology, the type of immunoglobulins and the deposition pattern (capillary, mesangial, granular, linear along the glomerular basement membrane) differ. Only in Goodpasture syndrome, linear deposits are found along the glomerular basement membrane. In case of an ANCA triggered form immune deposits are missing (pauci-immune RPGN). In contrast, in immune-complex vaculitis there can be found a different picture, usually with granular deposition of IgG, IgM, IgA or complement.

2.2.5 Bronchoscopy
The diagnosis of diffuse alveolar hemorrhage includes the clinical picture and a bronchoscopy with a bronchoalveolar lavage and the microscopic detection of siderophages. Especially in the case of diffuse infiltrates in imaging without hemoptysis a bronchoscopy can be helpful and a definite diagnosis can be established [Hauber 2007].
3. Differential diagnosis of the pulmonary-renal syndrome

As already stated the pulmonary-renal syndrome is usually caused by a systemic small vessels vasculitis (Tab. 2), these can be categorized [Niles 1996, Salant 1987, De Groot 2005, Jennette 1994 & Falk 1997]:
- morphological criteria (size of the infesting vessels, presence or absence of granulomas),
- etiological criteria (idiopathic or secondary forms) and
- immunological criteria (ANCA-associated vasculitis, immune-complex vasculitis or caused by anti-basement antibodies).

3.1 ANCA-associated small vessel vasculitis

The Chapel Hill Consensus Conference classification defines [Jennette 1994]:
1. Wegener’s granulomatosis,
2. microscopic polyangiitis and
3. Churg-Strauss syndrome.

Renal involvement is present in many systemic diseases, especially in the small vessel vasculitis – pointed out by Gallo in the New England Journal of Medicine: "The kidney is often a window on systemic disease" [Gallo 1991].

The suspicion of a pulmonary-renal syndrome in an ANCA-associated systemic vasculitis can often be taken from a careful history and thorough clinical examination with detection of other vasculitic signs (eye inflammation, intractable rhinitis / sinusitis, skin rashes, arthralgia, myalgia or polyneuropathy) (Fig. 2).

Table 2. The most important differential diagnoses of pulmonary-renal syndrome with clinical features, laboratory and histological findings.
3.1.1 Wegener's granulomatosis
Wegener's granulomatosis is a necrotizing vasculitis of the small and medium-sized vessels, associated with granulomas inflammation of the upper and lower respiratory tract and the frequent finding of glomerulonephritis. In active disease in about 90% of cases c-ANCA are directed against proteinase 3 (Tab. 1 and 2). Figure 3 shows the predominant symptoms in image and Figure 4 in number (at onset and during disease) [Hoffmann 1992].

Fig. 3. Wegener's granulomatosis.

![Graph showing organ involvement](graph_url)

Fig. 4. Organ involvement in Wegener's granulomatosis.

3.1.2 Microscopic polyangiitis
Microscopic polyangiitis is characterized by a necrotizing vasculitis of small vessels with minimal or missing immune deposits and an inflammation of the pulmonary capillaries. Typically, there are p-ANCA directed against myeloperoxidase (Tab. 1 and 2) [Jennette 1994 & Falk 1997]. Wegener’s granulomatosis and Microscopic polyangiitis shows comparable organ involvement, but the symptoms of the upper respiratory tract are usually milder in Microscopic polyangiitis, because there is no granulomatous inflammation. Compared to Wegener's granulomatosis disease recurrence is rare in patients with Microscopic polyangiitis.
3.1.3 Churg-Strauss syndrome
The Churg-Strauss syndrome is characterized by recurrent asthma attacks and allergic rhinitis, an intermittently or permanently detectable eosinophilia (> 1500/mm$^3$) and necrotizing granulomas and/or necrotizing arteritis with a Wegner’s granulomatosi-like presentation. The serological diagnosis is less clear: c-ANCA or anti-PR3-Ab detected only rarely, p-ANCA and anti-MPO-Ab can be detected in up to 60% of cases (Tab. 1 and 2) [Hoffmann 1992]. The Churg-Strauss syndrome can be distinguished clinically (asthma attacks, eosinophilia) from Wegener’s granulomatosis or Microscopic polyangiitis. Renal involvement is seen in approximately 25% of patients.

3.2 Goodpasture syndrome
The Goodpasture's syndrome is a rare disease with an incidence of 0.1-1 per million per year and affects mainly caucasian males. It is characterized by hemoptysis and/or radiological evidence of pulmonary infiltrates and a RPGN, which usually develops after hemoptysis. There is the very reliable detection of anti-GBM antibody, the identified antigen is the C-terminal end of the alpha-3-chain of type IV collagen. The immunohistological workup of the renal biopsy shows linear IgG deposits in the glomerular basement membranes (Tab. 1 and 2) [Goodpasture 1919, Salama 2001, Pusey 2003 & Hudson 2003]. Compared to the ANCA-associated small vessel vasculitidies (Wegener’s Granulomatosis, Microscopic polyangiitis and Churg-Strauss syndrome) there are no other, general vasculitic symptoms in patients with Goodpasture syndrome.

3.3 Immune-complex vasculitis of small vessels
Immune-complex vasculitidies like
1. systemic lupus erythematosus,
2. cryoglobulinemic vasculitis and
are important differential diagnostic considerations of the pulmonary-renal syndrome. They can be distinguished by the previously described extended-serological diagnostic workup.

3.4 Further differential diagnoses
If this diagnostic workup is unremarkable, there are several more differential diagnosis:
1. antiphospholipid syndrome with vasculitis and/or pulmonary embolism
2. mixed connective tissue diseases (systemic sclerosis, polymyositis)
3. thrombotic thrombozypenic purpura.
4. infectious diseases involving kidney and lung (e.g Hanta-virus, cytomegalie-virus, Legionella, Mycoplasma, Leptospirosis, tuberculosis, sepsis)
Moreover, a primary renal disease can lead to a pulmonary disease and mimic the image of a pulmonary-renal syndrome:
1. acute renal failure with pulmonary edema and uremic hemoptysis
2. thromboembolism in nephrotic syndrome: renal vein thrombosis and/or pulmonary embolism
3. immunosuppression in renal disease and a pneumonia.
Conversely, a primary pulmonary disease can lead to renal disease and can mimic the image of pulmonary-renal syndrome:
1. Infection of the respiratory tract with prerenal renal failure and/or postinfectious glomerulonephritis or hematuria in IgA nephropathy
2. Lung cancer with immune-complex nephritis.

4. Conclusions
Since early treatment with the mentioned diseases is critical, the diagnosis has to be established quickly - the fast antibody-diagnostic and diagnostic imaging have a central role.

This work was supported by the Robert-Bosch Foundation.

6. References
An Update on Glomerulopathies - Clinical and Treatment Aspects is a systemic overview of recent advances in clinical aspects and therapeutic options in major syndromes of glomerular pathology. The book contains twenty four chapters divided conveniently into five sections. The first section deals with primary glomerulopathies, and the second section is devoted to glomerulopathies complicating infectious conditions. The third section deals with systemic autoimmune disorders and vasculitides which constitute major causes of glomerular disease and often renal failure. The fourth section includes chapters discussing the glomerular involvement in some major metabolic and systemic conditions. The final section has chapters which relate to some general aspects of glomerular diseases. This book will form an excellent reference tool for practicing and academic nephrology community.
