1. Introduction

Considered in ancient times as a connection to the divine, the use of this medicinal plant is as old as human civilization itself. Whole nations dominated its secrets, often associated with magic and religious rites, searching in nature's resources to improve life conditions, and increase chances of survival (Herbarium, 2008).

In 1978, the World Health Organization (WHO) recognized folk medicine and its beneficial effects to health, during the *Alma Ata* conference, which published in 1985 that approximately 80% of the global population, resorted to traditional medicine as their primary health treatment (Herbarium, 2008). Medicinal plants have been used as a means of curing or preventing diseases, now called phytotherapy, in all regions of the world, with regional variations due to the influence of cultural characteristics of the population, as well as its flora, soil and climate (Lewinsohn, 2003).

Since the nineteenth century, humanity discovered the endless and diverse therapeutic arsenal present in medicinal plants, due to the discovery of active substances that in their natural state or after chemical transformation showed biological activity, and often already confirmed by popular use and/or proven scientifically (Miguel & Miguel, 2004).

According to Yamada (1998) it is necessary to carry out more studies and to propagate medicinal plant utilization as a way to diminish the costs of public health programs since the utilization of these plants may constitute a very useful therapeutic value due their efficacy coupled with low operating costs and the relative ease of obtaining the plants (Matos, 1994).

According to Brazilian legislation, a new herbal medicine can be introduced to the market in two forms: as a finished product – industrially produced, or as an official product – manufactured in pharmacies. Both forms should ensure quality, safety and efficacy of the herbal medicines supplied to the consumer. On the other hand, medicinal plants sold at popular markets or obtained directly from farmers at an informal market, have no guarantee provided by law, especially with regards to safety and efficacy (Herbarium, 2008). However we cannot rule out the cultural importance that popular knowledge inputs, being transmitted from generation to generation.

The WHO strategy on traditional medicine for the period of 2002-2005 has brought as one of its objectives, the strengthening of traditional remedies by placing them in the National Health Systems through policies and programs determined by their respective governments. The National Policy on Integrative and Complementary Practices of the Brazilian Unified Health System (SUS, *Sistema Único de Saúde*) (2006), for example, fulfills these requests by proposing the inclusion of medicinal plants, phytotherapy, homeopathy, traditional Chinese medicine, acupuncture, hydrotherapy and crenotherapy as therapeutic options for the SUS. Another example is the Brazilian National Policy on Medicinal Plants and Herbal Medicines, which includes as one of its guidelines the promotion and recognition of popular practices in the use of herbal and home remedies. Therefore, a strategy that can be used to meet this demand proposed by the federal government is to conduct a survey of plants used by communities in order to strengthen with the establishment a list of Medicinal Plants of Interest to SUS (RENISUS), which aims to give priority to the naturally occurring species of regions or to those easily cultivated. In this context, the Brazilian Ministry of Health released the RENISUS list, containing 71 species of medicinal plants for therapeutic use (<http://portal.saude.gov.br/portal/arquivos/pdf/RENISUS.pdf>).

2. The Fabaceae family

Also known as a sub-family of Leguminosae, the Fabaceae family is one of the largest botanical families and widely distributed around the world, spread out over temperate, tropical and cold regions. Thus family is composed of 32 tribes, whose genera are chemically represented by a variety of flavonoid skeletons, notably pterocarpanes and isoflavones. There are about 650 genera comprising about 18,000 species (Polhil & Raven, 1981). The genus *Erythrina* is represented by about 290 species (Cronquist, 1981; <http://www.tropicos.org/Name/40005932>). The Fabaceae family produces valuable medicinal drugs, ornamental species, fodders plants, oil producing plants, insecticides and species with various other functions (Salinas, 1992).

3. The *Erythrina* Genus

The genus *Erythrina* is one among several genera from the Fabaceae family. The origin of the name *Erythrina* comes from the Greek word “erythros” which means red, alluding to the bright red flowers of the trees of the genus (Krukoff & Barneby, 1974). Over 130 species of “coral tree” belong to the genus *Erythrina*, which has been widely studied and are distributed in tropical and subtropical regions of the world. In South America, these species are present in Argentina, Bolivia, Paraguay, French Guiana, Colombia and Peru (Hickey & King, 1981). In Brazil the genus is spread throughout all of the Brazilian biomes, like the Atlantic forest, *cerrado*, Amazon rainforest and Brazilian northeast *caatinga* (Corrêa, 1984). In Brazil, there are eight species found: *E. mulungu*, *E. velutina*, *E. cista-galli*, *E. poeppigiana*, *E. fusca*, *E. falcata*, *E. speciosa* and *E. verna* (Lourenzi, 1992).

Phytochemical analysis has demonstrated the presence of terpenes in plants from the *Erythrina* genus (Serragiotto et al., 1981; Nkengfack et al., 1997), that are also recognized as bioactive alkaloid-rich plants (Ghosal et al., 1971; Barakat et al., 1977) and flavonoids, especially, isoflavones, pterocarpanes, flavanones and isoflavanones (Chacha et al., 2005). Some of these flavonoids have demonstrated a wide variety of biological activities (Table 2).

Studies have demonstrated the presence of analgesic and anti-inflammatory effects in extracts obtained from *E. senegalensis*, *E. velutina* and *E. mulungu* (Vasconcelos et al., 2003). In folk medicine, various species are utilized as a tranquilizer, against insomnia and to treat inflammation (Garcia-Mateos et al., 2001).

3.1 Bibliographic review

We conducted a literature review using the database SciFinder Scholar®, and from the results obtained, we prepared two tables of data showing the correlation between popular use and the plant part utilized, as well as the form of utilization (Table 1), and the biological activities of the extracts obtained from *Erythrina* species (Table 2). Due to the large amount of data for phytochemicals isolated from the *Erythrina* species, we organized them in a simplified table (Table 3).

Uses	Part Utilized	Kind of Extract/Way of Use and Administration	Species	Locality	Reference
Trachoma	Bark	Unspecified, oral	<i>Erythrina abyssinica</i>	Kenya	Ichimaru et al. (1996) Kamat et al. (1981) Moriyasu et al. (1998)
Malaria	Roots	Unspecified, oral			
Syphilis	Roots	Unspecified			
Elephantiasis	Bark	Unspecified, external			
Colic	Roots	Decoction, oral	<i>Erythrina abyssinica</i>	Tanzania	Chhabra et al. (1984)
Syphilis	Flowers	Infusion, oral	<i>Erythrina abyssinica</i>	Uganda	Kamusiime et al. (1996)
Fever Leprosy	Leaves	Unspecified, oral	<i>Erythrina abyssinica</i>	Rwanda	Chagnon (1984) Boily & Van Puyvelde (1986) Maikere-Faniyo et al. (1989) Vlietinck et al. (1995)
Dysentery	Stalk				
Gonorrhoea	Stalk				
Hepatitis	Stalk				
Schistosomiasis of the urinary tract	Unspecified	Decoction, oral	<i>Erythrina abyssinica</i>	Zimbabwe	Ndamba et al. (1994)
Poison antidote	Roots	Unspecified	<i>Erythrina abyssinica</i>	India	Selvanayahgam et al. (1994)
Anthelmintic	Green bark stem	Unspecified, oral	<i>Erythrina abyssinica</i>	East Africa	Kokwaro (1976)
Contraception	Bark	Unspecified, oral	<i>Erythrina americana</i>	Mexico	Hastings (1990) Dominguez & Alcorn (1985)

Table 1. Popular uses of *Erythrina* species

3.1.1 Ethnopharmacological data

Plants of the *Erythrina* genus are utilized for a wide array of human diseases (Table 1). With regards the parts of the plants that are utilized, the most used is the bark, being 40.8% of the total of citations, as shown in Graphic 1.

Graphic 1. Parts of the plants utilized in folk medicine.

3.1.2 Biological activity data

Analysis of the biological activity data (Table 2) shows the wide variety of biological activity of plants from the *Erythrina* genus, and shows too that most of this corroborates with popular knowledge and uses.

It is noteworthy to point out that most of these activities, mainly the antibacterial and analgesic properties, confirm the different popular applications of extracts obtained from plants of this genus. We would like also to draw attention to the fact that in the Brazilian market there is the availability of a phytotherapeutic product from *Erythrina mulungu* widely used for anxiolytic purposes and as a sedative, activities confirmed by popular knowledge, but that, to our knowledge, have not yet been confirmed in pharmacological tests, showing that, despite the wide array of available data related to plants of this genus, there is still a need for more research about some of them.

It is important to note that some of the activities shown in the biological tests were not cited in the ethnopharmacological studies, which indicates yet another importance for plants of the *Erythrina* genus, which have the potential to provide new compounds for the development of drugs for the treatment of diseases such as cancer, diabetes and hypertension.

3.1.3 Phytochemical data

The phytochemical data (Table 3) analysis allowed for the verification of a predominance of alkaloids and flavonoids in the *Erythrina* genus. It is important to note that alkaloids are recognized as markers for plants of this genus in addition to showing a wide array of biological activities, and being important candidates in the development of new drugs.

Species	Part of the Plant	Biological Activities	Location	Reference

Table 2. Biological activity of *Erythrina* extracts.

Classes of Compounds	Occurrence	Percentage
Alkaloids	461	41.57
Coumarins	1	0.09
Steroids	29	2.62
Flavonoids	330	29.76
Lipids	32	2.88
Proteins	112	10.10
Triterpenes	31	2.80
Other compounds	113	10.19
Total	1109	100

Table 3. Occurrence of the different classes of compounds in the *Erythrina* genus

Some important alkaloids that are distributed within plants from the *Erythrina* genus are erytharbine, erythartine, erysotramidine and erysotrine, shown in figure 1. It is noteworthy that a characteristic feature of these alkaloids is the spiro structure in the rings bearing the nitrogen atom.

Fig. 1. Common alkaloids found in the *Erythrina* genus.

4. Conclusion

This review showed that *Erythrina* species are commonly utilized for numerous diseases and that many ethnopharmacological studies have been performed in order to confirm the activities attributed to these species. Moreover, several classes of substances have been isolated from the *Erythrina* genus, mainly alkaloids (41.57%) and flavonoids (29.76%).

Despite the large amount of available data, some of the plants of this genus remain to be studied. An example is *Erythrina mulungu*, largely used in Brazil, yet a significant number of studies regarding its pharmacological properties and chemical composition were unable to

be found. A recent contribution to the knowledge about this plant is given by our group, regarding the anti-inflammatory and antinociceptive activities of a hydroalcoholic extract obtained from *E. mulungu* (Oliveira et al., *in press*).

5. Acknowledgments

The authors acknowledge the Brazilian National Research Council (CNPq), FAPEAL and CAPES for their financial support in the form of grants and fellowship awards.

Phytochemicals - A Global Perspective of Their Role in Nutrition and Health

Edited by Dr Venketeshwer Rao

ISBN 978-953-51-0296-0

Hard cover, 538 pages

Publisher InTech

Published online 21, March, 2012

Published in print edition March, 2012

Phytochemicals are biologically active compounds present in plants used for food and medicine. A great deal of interest has been generated recently in the isolation, characterization and biological activity of these phytochemicals. This book is in response to the need for more current and global scope of phytochemicals. It contains chapters written by internationally recognized authors. The topics covered in the book range from their occurrence, chemical and physical characteristics, analytical procedures, biological activity, safety and industrial applications. The book has been planned to meet the needs of the researchers, health professionals, government regulatory agencies and industries. This book will serve as a standard reference book in this important and fast growing area of phytochemicals, human nutrition and health.
